Description

For **Assignment 2**, you will *redesign a notable information graphic using contemporary interactive methods*. Design sketches, prototypes, and notes are to be included in a document that shows various iterations and provides a rationale for design decisions. This assignment will be due in Week 7, and will be worth **15% of the final grade**.

You may choose one of the following three graphics to redesign:

- Snow's cholera map:

- Minard's Russian campaign:

- Nightingale's coxcomb:

Marking

Your submission will be assessed based on three criteria:

- **Creativity:** Creative interpretations of this assignment are highly encouraged! You can do speculative design (just be sure to use real data or make it clear that your data is imaginary). You can construct hand-drawn sketches and physical prototypes. You can spin fictional narratives. You can use wild colour scales. Your goal is not to make the original graphic "better," necessarily, but to present new facets of it, or make it compelling to a new audience.
- **Structure:** Ask yourself whether changing the graphical structure also changes what the visualization can do. Does it become more persuasive? Does it shift registers and become an exploratory object rather than a rhetorical/evidential one? Some additional questions you might consider: How do modern interaction techniques and formats alter the visualization? Are there comparisons to contemporary graphics that might be relevant?
- **Quality:** While you are not expected to publish the results of this assignment, you should be thinking about an external audience. As such, what you present should be clear, concise, and well-written. Make sure to proofread for grammar and spelling mistakes!

Submission

Submissions can be prepared as Jupyter (Python) or Observable (JavaScript) notebooks, Shiny (R) apps, custom web pages, or .pdf documents. Templates and resources have been provided in the Assignments folder of the Shared Drive.

Here are some tips if you decide to create a Jupyter notebook. If your .ipynb file points to images or data files that are stored on your computer, then you must also submit a directory/folder that includes them. Best practices for doing this:

- Create a directory named after the creator of the visualization you're redesigning (for example, *snow*).
- Inside that directory, create a sub-directory named *data*. If you're using data files (like .csv or .txt files), store them in there.
- Create another sub-directory named *images*. If you're referring to local images in your .ipynb markdown cells, store them in this directory.
- Make sure your .ipynb image and data references point to the proper locations, as I will need to load and run everything.
- Run all your cells and make sure they render properly!
- Comment your code.
- Compress your main directory and save it as *yourlastname_assignmentone.zip* and then submit the .zip file.

If you want to share an online notebook instead, create a Google Colaboratory document and share the url when submitting your assignment.
